

LIQUID PH/CHLORINE SYSTEM

HOW IT WORKS: The amount of water being used is accurately measured by the pulse meter. A reed switch in the meter signals the chemical metering pump as every 1/10 of a gallon of water is used.

The Aqua Accelerator is a multistage mixing chamber that blends the chemical instantly with the untreated water.

The chemical metering pump injects a precise amount of chemical under high pressure into the turbulent water stream created by the mixing tube.

TANK

SODIUM HYDROXIDE
